

WEBSITE LAUNCH PROGRAM | SIGN-OFF REGISTER

Executive Sign-Off Register

Everything that needs a named signature before airevacinternational.com is public, and what the website does in the meantime. Twenty-six items. Prepared 30 July 2026.

You can demonstrate the site today without signing any of this

The preview is invisible to search engines. It tells every crawler not to index it and every page carries a no-index instruction, so nothing on it reaches the public or a search result. Open it, use the chat, sign into the coordinator console, show any of it to anyone. None of the approvals below are needed for that.

Every one of them is needed before the site is public.

What the build team has already decided, and does not need you to confirm: framework and hosting, security architecture, database design, accessibility implementation, test coverage, and the redirect map. Those are ours. If one is wrong it is our mistake to fix. Everything in this document is something we deliberately did not decide, because it was not ours to decide. Where we needed to pick something to keep building, we picked the cautious option, and that choice is in the last column.

1. Legal and privacy

#	Who signs	What they are approving	What the site does while unsigned
L1	Legal counsel	Website Privacy Notice. Currently describes the site as built, including what it refuses to collect.	The page shows a visible "under review" banner. The banner is accurate and must not be removed to make the site look finished.
L2	Legal counsel	Notice of Privacy Practices.	Same banner.
L3	Legal counsel	Terms of Use.	Same banner.
L4	Legal and privacy	Privacy notice rewritten to describe live chat. L1 and L2 both describe a website that receives no clinical information. A chat makes that false within the first minute of the first conversation.	Hard gate on chat going public. Chat is on for the preview and stays off on the live domain until this is done.
L5	Legal and billing	Whether a patient cost notice is legally required. The previous page was removed by the July handoff. Its content is archived and can be restored in an hour.	No notice is published. If one is required and absent, that is a compliance exposure rather than a missing page.
L6	Privacy officer	Business Associate Agreement covering the database. Available on the current hosting plan, but a BAA is a signed contract rather than a plan feature, so it has to be requested and executed.	Chat stays off on the live domain. Only test data goes in the database.
L7	Privacy officer	Retention schedule for chat transcripts. The build uses a provisional 30 days.	30 days applies, and the privacy notice cannot state a number AirEvac has approved.
L8	Privacy officer	Email and fax handling of clinical documents. The site tells people to send records to ops@aeiamerica.com or fax (619) 330-4551.	The instruction is published with no documented process behind it.

2. Clinical

#	Who signs	What they are approving	What the site does while unsigned
C1	Medical Director	Named clinical reviewers for the medical pages, with credentials, and their agreement to be publicly named.	Every medical page shows the "under review" banner and no reviewer appears in the machine-readable data. Search engines and AI systems see no named medical authority behind the clinical content, which is a real credibility gap in this industry.
C2	Medical Director	Crew credentials and equipment claims , if any are to be published.	The site describes how crews are assigned and publishes no specific certification or equipment model.
C3	Medical Director	The conditional 90-minute response wording in the service questions.	Published as written in the July handoff, unapproved.

3. Aviation and operations

#	Who signs	What they are approving	What the site does while unsigned
A1	Director of Operations	The public fleet statement , "two Learjet 31A aircraft". No registration appears anywhere on the site.	Published as written in the July handoff, unapproved.
A2	Director of Operations	Certificate-holder wording , and whether the certificate number may be published.	The site says AirEvac coordinates directly with no broker in between, and claims no operating authority anywhere.
A3	Director of Operations	Route detail on the twelve route pages : ground transfer times, hospital and discharge realities, border paperwork. Drafted from general regional knowledge, not AirEvac case files.	Live and hedged throughout, but unconfirmed. Corrections take effect the same day.
A4	Director of Operations	Service area boundaries : which regions are routine and which are case by case.	Four regions published, with "other destinations are reviewed case by case".
A5	Operations	Chat staffing, and whether the site may say so. AirEvac staffs coordinators around the clock, so a coordinator is now marked available automatically on sign-in, the console warns whenever nobody is, and operations is emailed if a gap lasts more than three minutes. What needs a signature is the <i>claim</i> : publishing "chat answered 24/7" is a promise, and the blueprint asked for a 30-day staffing test before chat became customer-facing.	Chat runs and is monitored, but no page claims it is always answered. The widget still tells visitors honestly when nobody is available and shows the phone number.

4. Compliance and credentials

#	Who signs	What they are approving	What the site does while unsigned
K1	Compliance lead and Executive sponsor	EURAMI accreditation publication. The register holds the exact scope, an expiry of 25 August 2027, and a public verification address. What is missing is confirmation that the certificate itself is on file.	The site publishes no accreditation at all: not on the credentials page, not in the machine-readable data, not in the file AI systems read. The highest-value item on this register.
K2	Compliance lead	NAAMTA: renewed certificate, or a decision to omit.	Held. Appears nowhere. The word is blocked from page copy by an automated test.
K3	Director of Operations	ARGUS: current rating evidence, or a decision to omit.	Held. Appears nowhere.
K4	Director of Operations	Learjet 35 status: active, reserve, partner-operated, or retired.	Held. Public copy states only the two Learjet 31As.
K5	Compliance lead	State EMS licences and marketed-base authority.	No operating-authority claim appears on any page.
K6	Compliance lead and Legal	Publishing Cuba (Havana) as a served destination. Added to the coverage map at AirEvac's request on 30 July 2026. A United States operator advertising Cuba touches US sanctions rules: medical evacuation is generally licensable, but it is not automatically permitted, and what is published is what a regulator reads.	The destination is live on the map. It claims no authority to fly there, but the destination itself is what needs confirming.

5. Commercial

#	Who signs	What they are approving	What the site does while unsigned
M1	Pricing and legal	The Price Lock Guarantee wording on the Private Pay page.	Published as written in the July handoff, unapproved.
M2	Marketing	Analytics. Approved in principle and built. Needs a Google Analytics measurement ID and the privacy notice updated to match.	No measurement of any kind runs.
M3	Leadership	Photography AirEvac has permission to publish, with anyone identifiable cleared.	Images are taken from the existing website.
M4	Leadership	Profile and directory addresses for the machine-readable organisation record.	The strongest signal that this is a real, corroborated organisation is absent.

6. Not sign-offs, but they still block launch

These are engineering and account tasks rather than approvals. They are here so nobody assumes the signatures above are the whole list.

- **The transport request form delivers nowhere.** It issues a reference and sends a notification; it does not create a case in any system of record. Either connect an approved intake system or remove the form and lead with phone and email. A form that silently reaches nobody is worse than no form.
- **Rate limiting works on one server only.** The published limits are not the effective limits behind more than one. Moves to the network edge.

- **The real domain is not attached.** The site answers on a temporary hosting address. Indexing it would teach search engines an address that is going to change.
- **Manual accessibility testing has not been done.** Automated checks pass on 17 pages. Screen-reader, keyboard, and 400% zoom review by a person has not happened, and automated tooling catches roughly a third of the failures that matter.
- **Chat runs on one server only.** A second would leave each side of a conversation seeing only their own messages, which reads as the other person having stopped replying. Lifting this is a known change.
- **The database connection is encrypted but unverified.** The managed database presents a self-signed certificate, so the preview runs without checking it. Traffic is protected from anyone listening, but not from an attacker positioned between the site and the database. Supplying the provider certificate closes it and takes effect on its own. Must be done before the database holds real conversations.

7. What is safe to demonstrate today

Everything. To be specific:

- The full public site, in English and Spanish.
- The coordinator console: sign-in, user management, and the audit log.
- **Live chat, end to end:** the queue, claiming a conversation, replying, and the transcript notification. Run successfully on the preview on 30 July 2026.
- **Translation**, using clearly marked placeholder text until the AWS account is connected. It reads "[TEST TRANSLATION ES to EN] ... [NOT A REAL TRANSLATION]", which is deliberately impossible to mistake for a real one.

Two things behave differently on the live domain, enforced in the software rather than by instruction, so a demonstration setting cannot quietly become a launch setting: chat is off by default there and on by default everywhere else, and placeholder translation is refused outright on the live domain.

An item without a name on it is not approved, whatever was said in a meeting. Print this page, sign it, and keep it with the launch file.
