

WEBSITE LAUNCH PROGRAM | REVISION 3.0

Sign-Ups and Accounts Required

Every account AirEvac needs to create, claim, or grant access to before the website can launch. None of this requires technical knowledge, and none of it can be done by the build team: each action needs AirEvac to own the account. Prepared 30 July 2026.

Status since revision 1.0

Render hosting is DONE. The paid production instance is live, so the site no longer sleeps between visits. A sleeping site answers search crawlers and 2 a.m. callers late or not at all, so this mattered more than its cost suggested.

The remaining items are ordered by dependency. Sections 1 and 2 unlock everything else, because every later step needs the real web address to exist first.

1. Domain and DNS (everything else waits on this)

The site currently answers at a temporary Render address. Search engines and AI systems should only ever learn one permanent address, so this should happen before the site is submitted anywhere. Attaching the domain also permanently resolves the certificate warning a reviewer saw earlier: that error is what a browser shows when a domain is visited before it is attached to its host.

- **Decide the address form:** `www.airevacinternational.com`, or `airevacinternational.com` without the `www`. Either is fine. It has to be one of them, everywhere, permanently. If you have no preference, tell us and we will use the shorter one.
- Sign in to the domain registrar account for `airevacinternational.com`. If nobody knows who holds it, that is the first thing to find out, and it is often the longest item on this page.
- In Render, open the web service, then Settings, then Custom Domains, and add the chosen address. Render displays the exact DNS records to create.
- Create those records at the registrar exactly as Render displays them.
- Wait for Render to report the domain verified with a certificate issued. Usually minutes, occasionally an hour.
- **Do not change the DNS for the current WordPress site until you are ready to switch over.** Changing DNS is the switch-over.

Send us: the address form you chose, and the date you want to go live.

2. Google Search Console

Free, changes nothing on the website, and is the only way to see what Google has actually indexed and what it is failing to reach.

- Go to `search.google.com/search-console`, signed in with an AirEvac Google account that the company controls. Not a personal account, and not an employee account that leaves when they do.
- Add a property, choose the **Domain** type, and enter `airevacinternational.com`.
- Google shows a TXT record. Add it at the registrar, return, and click Verify.
- Open Sitemaps in the left menu and submit: `sitemap.xml`

- Open Settings, then Users and permissions, and add the build team with Full access.
- If a property already exists for the old WordPress site, **do not delete it**. Its history is useful. Grant access to that one as well.

3. Bing Webmaster Tools

Bing matters more than its search share suggests: it supplies Microsoft Copilot and feeds results that several AI assistants read.

- Go to bing.com/webmasters, signed in with an AirEvac Microsoft account.
- Choose **Import from Google Search Console**. It copies the verification and the sitemap in one step.
- Confirm `sitemap.xml` appears under Sitemaps, and add the build team as a user.

Nothing needs creating here for IndexNow, the protocol that tells Bing immediately when a page changes. It is already built into the site and switches on with the key in section 6.

4. Google Business Profile

One profile, for the Fort Lauderdale base only. Do not create listings for cities AirEvac flies to. A Cancun listing for a Fort Lauderdale company reads as fabricated to Google and to AI systems, and it damages exactly the credibility this whole effort is trying to build.

- Go to business.google.com with the same AirEvac Google account as section 2.
- Create or claim the profile for: AirEvac International, 2525 NW 55th Court, Hangar 24, Fort Lauderdale, FL 33309.
- If a profile already exists from the old site, **claim and correct it** rather than creating a second one. Duplicates split your credibility.
- Category: the closest available to air ambulance service. If that is not offered, use a medical transport or emergency service category. Do not pick an aviation charter category, which describes a different business.
- Phone: (619) 754-6755. Website: the address from section 1. Hours: open 24 hours, seven days.
- Because clients do not visit in person, review the service-area settings with the build team before publishing.
- Add only photography AirEvac has permission to publish.
- Complete verification (postcard, phone, or video), then add the build team as a manager.

5. Bing Places

- Go to bingplaces.com and choose Import from Google Business Profile.
- Confirm the imported name, address, phone, and hours match section 4 exactly.

6. Analytics and IndexNow keys

Both are built into the site already and are waiting only for an identifier. Until each arrives, that feature stays completely switched off. Nothing is half-enabled.

What	How to get it	What to send us
Google Analytics 4 Approved, built, inactive	At analytics.google.com create an account named AirEvac International and a web property for the final domain. Do not install any code: the site already contains it, configured to anonymize addresses and to block advertising use of the data.	The Measurement ID, which looks like G-XXXXXXXXXX. Also add the build team with edit access.
Google Tag Manager Optional	At tagmanager.google.com create a container for the same domain. Only needed if marketing wants to add tracking later without a developer.	The Container ID, which looks like GTM-XXXXXXX.
IndexNow key Built, inactive	Nothing to sign up for. The build team generates it. It tells Bing within minutes when a page changes.	Nothing. Listed so you know it exists.

We recommend **declining** session-recording tools such as Microsoft Clarity, which record a visitor screen and typing. This site is used by people arranging urgent medical transport, and no analysis is worth recording that. None is installed.

7. Listing consistency (do this once, then keep it)

Everywhere AirEvac appears online must show identical details. Search engines and AI systems cross-check them, and a mismatch reads as an unreliable business. The correct version is:

Field	The one correct value
Name	AirEvac International
Address	2525 NW 55th Court, Hangar 24, Fort Lauderdale, FL 33309
Phone	(619) 754-6755
Email	ops@aeiamericas.com
Fax (clinical records)	(619) 330-4551
Website	The address chosen in section 1

Worth updating or creating with exactly these details: the Fort Lauderdale Executive Airport tenant directory, the EURAMI provider listing, any air ambulance or medical transport directories AirEvac already appears in, chamber of commerce membership, and every social profile. **Old listings showing a previous phone number or the Scottsdale address actively work against you** and should be corrected or removed.

8. Live chat: accounts and agreements (new in revision 3.0)

The website now includes a live chat that connects a visitor to a flight coordinator, with a console for coordinators to sign into and automatic translation between English and Spanish. It is built, deployed, and has been used end to end on the preview. The items below are what it needs before it can face the public.

A chat receives patient details within the first minute of the first real conversation. Everything in this section exists because of that sentence.

- **Database: DONE.** A managed PostgreSQL instance is running alongside the website and holds coordinator accounts and conversation transcripts.

- **Business Associate Agreement with the hosting provider.** Available on the current plan, but a BAA is a signed contract rather than a plan feature: somebody at AirEvac has to request and execute it. Until it exists, only test data may go in the database and chat stays off on the real address. This is the single blocking item for chat.
- **Database certificate.** The connection is encrypted today but does not verify what it is connecting to, because the provider presents a self-signed certificate. Downloading the provider certificate and adding it closes this. A ten-minute task for whoever holds the hosting account.
- **AWS account, for translation.** Amazon Translate is the service chosen for English and Spanish. Until it is connected the site shows clearly marked placeholder text that nobody could mistake for a real translation. Needs an account, a restricted access key, and an AWS Business Associate Addendum, because message text leaves our systems for theirs.
- **Email sending service.** After each conversation ends, a notification goes to an operations address for the record. Today those notifications are written to the server log instead of sent, which is a safe working state and lets you see exactly what would go out. Sending for real needs an account with a provider that will sign a BAA.
- **Coordinator accounts.** Decide who gets one. The administrator creates them in the console; each person sets their own password on first sign-in, so no administrator ends up knowing a coordinator password.

9. Access checklist

Platform	AirEvac action	Access for the build team
Domain registrar	Add DNS records (sections 1 and 2)	None needed if AirEvac adds them
Render	Done, paid instance live	Team member
Google Search Console	Verify domain, submit sitemap	Full user
Bing Webmaster Tools	Import from Search Console	User
Google Business Profile	Create or claim, verify	Manager
Bing Places	Import from Google	Shared login or none
Google Analytics 4	Create property, send Measurement ID	Editor
Tag Manager (optional)	Create container	Editor
Hosting BAA	Request and execute; blocks chat	None needed
AWS	Create account, sign the BAA, issue a key	Key only
Email sending service	Create account, sign the BAA	API key
