

AI SEARCHABILITY PROGRAM

External Accounts and Platform Setup Guide

Step-by-step actions on Google, Bing, Render, and your domain registrar that require AirEvac account ownership. The website build team cannot perform these: they must be done by, or under the accounts of, AirEvac. Companion to the AI Search Coding Handoff. Prepared July 30, 2026.

Order matters: complete section 1 (domain) and section 2 (hosting) first. Sections 3 through 6 depend on the final domain being live. Section 7 waits for the analytics decision (item A2 in the companion approvals document).

1. Domain and DNS (do this first)

The site currently runs at airevac-international-website.onrender.com. Search engines and AI systems should only ever learn one permanent address. The certificate warning a reviewer saw earlier is what happens when the custom domain is visited before it is attached to the host; completing this section makes that error impossible.

- Decide www.airevacinternational.com or airevacinternational.com (item A3). Every later step uses that choice.
- Sign in at the domain registrar for airevacinternational.com.
- In Render, open the web service, choose Settings, then Custom Domains, and add the chosen domain. Render shows the exact DNS records to create.
- Create those records at the registrar: a CNAME for www, or A/ALIAS records for the bare domain, exactly as Render displays them.
- Wait for Render to show the domain as verified with a certificate issued. This usually takes minutes, occasionally up to an hour.
- Keep the old WordPress hosting untouched until the new site is approved for cutover; changing DNS is the cutover.

Send the build team: confirmation of the chosen domain form, and the date you intend to cut over.

2. Render production settings

- Upgrade the web service from the free tier to a paid instance so the site never sleeps. A sleeping site answers crawlers and 2 a.m. callers late or not at all.
- Confirm the health check path is set to `/healthz`.
- Turn on log retention, or add a log stream, so crawler visits (Googlebot, Bingbot, ChatGPT and Claude search bots) can be inspected for blocks or errors.
- Add the build team's account to the Render team so deploys and logs are visible to them.

3. Google Search Console

This is how Google tells you what it has indexed and what is broken. It is free and does not change the website.

- Go to search.google.com/search-console signed in with an AirEvac Google account that leadership controls (not a personal account).

- Add a property. Choose the Domain property type and enter airevacinternational.com.
- Google shows a TXT record. Add it at the domain registrar, return, and click Verify.
- Open Sitemaps in the left menu and submit sitemap.xml.
- Open Settings, then Users and permissions, and add the build team's email with Full access.

If a Search Console property already exists for the old WordPress site, do not delete it: its history is useful. Grant the build team access to it as well (item F7).

4. Bing Webmaster Tools

- Go to bing.com/webmasters signed in with an AirEvac Microsoft account.
- Choose Import from Google Search Console; it copies the verification and sitemap in one step. Otherwise verify with a DNS record as in section 3.
- Confirm sitemap.xml appears under Sitemaps.
- Add the build team as a user.

Bing powers Microsoft Copilot and supplies results some AI assistants read, so this account matters more than Bing's search share suggests. The IndexNow protocol the handoff requires is implemented in code; nothing needs to be created here for it.

5. Google Business Profile

One profile, for the real staffed base only. The AI handoff is explicit: do not create listings for destinations served. A Cancun listing for a Fort Lauderdale company reads as fake to Google and to AI systems.

- Go to business.google.com with the same AirEvac Google account.
- Create or claim the profile for: AirEvac International, 2525 NW 55th Court, Hangar 24, Fort Lauderdale, FL 33309.
- If a profile already exists from the old site, claim and correct it rather than creating a second one.
- Category: choose the closest available to air ambulance service; if unavailable, use a medical transport or emergency-related category. Do not pick an aviation charter category: it describes a different business.
- Phone: (619) 754-6755. Website: the final domain from section 1. Hours: open 24 hours, all seven days.
- Because clients do not walk in, review the service-area settings with the build team before publishing the profile.
- Add only photography AirEvac has confirmed permission to publish (item F6).
- Verification is usually by postcard, phone, or video; complete it, then add the build team as a manager.

6. Bing Places

- Go to bingplaces.com and choose Import from Google Business Profile.
- Confirm the imported name, address, phone, and hours match section 5 exactly.

7. Google Analytics 4 and Tag Manager (only if approved)

Skip this section unless item A2 in the approvals document is approved, because the site's privacy notice must change first.

- At analytics.google.com create an account named AirEvac International and a web property for the final domain.
- At tagmanager.google.com create a container for the same domain.
- Do not install any code snippets; the build team wires both in with the privacy-safe event layer once approval and the notice update are done.
- Add the build team with edit access to both.

8. Listing and citation consistency

Everywhere AirEvac appears online must show the identical name, address, and phone number. Search engines and AI systems cross-check these; mismatches cost trust. The canonical version is:

Field	Canonical value
Name	AirEvac International
Address	2525 NW 55th Court, Hangar 24, Fort Lauderdale, FL 33309
Phone	(619) 754-6755
Email	ops@aeiamericas.com
Website	Final domain from section 1

Worth updating or creating with these exact details: the Fort Lauderdale Executive Airport tenant directory, the EURAMI provider listing (once status is confirmed), medical transport and air ambulance directories AirEvac already appears in, any chamber of commerce membership, and social profiles. Fix old listings showing the previous phone number or the Scottsdale address; those actively harm verification.

9. Access checklist

Platform	Action	Access to grant the build team
Domain registrar	DNS records from sections 1 and 3	None needed if AirEvac adds records; otherwise delegated DNS access
Render	Paid plan, custom domain, logs	Team member
Google Search Console	Verify domain, submit sitemap	Full user
Bing Webmaster Tools	Import from Search Console	User
Google Business Profile	Create or claim, verify	Manager
Bing Places	Import from Google profile	Shared login or none
GA4 / Tag Manager	Create only if A2 approved	Editor
