

AI SEARCHABILITY PROGRAM

Required Inputs and Approvals from AirEvac

Companion to the AI Search Coding Handoff. Everything in this document needs an answer, a fact, or a sign-off from AirEvac leadership, aviation operations, clinical leadership, or marketing. Nothing here requires technical knowledge. Prepared July 30, 2026 by the website build team.

How to use this document

Each item has an ID. Reply by email with the ID and your answer, attachment, or approval. Where a default is listed, the build proceeds with that default until you say otherwise, and the default is always the cautious option: nothing is claimed, published, or enabled without approval. Items marked BLOCKING hold up a visible part of the build.

1. Decisions required

ID	Decision	What we need from you	Default until answered
A1	AI crawler policy. Search crawlers (Google, Bing, ChatGPT search, Claude search) will be allowed so the site can be found and cited. Separately, some crawlers collect pages to train AI models.	Confirm whether to block model-training crawlers: GPTBot (OpenAI), Google-Extended (Gemini training), Applebot-Extended. Blocking them does not reduce search visibility.	Allow all search crawlers; block training-only crawlers.
A2	Analytics. BLOCKING for measurement only. The handoff recommends Google Analytics 4 and Tag Manager. The published privacy notice currently promises no analytics cookies, so adopting them requires a privacy notice update and a consent approach.	Approve or decline GA4 and Tag Manager. We recommend declining Microsoft Clarity session recording entirely: this site handles urgent medical contacts.	Measurement layer is built but disabled. No tracking runs.
A3	Domain form. The site must live at one address. The AI handoff assumes www.airevacinternational.com ; the build is currently configured for airevacinternational.com without www.	Choose www or non-www. Either works; it must be one, everywhere, forever.	Non-www, with www redirecting to it.
A4	Hosting plan. The free Render tier puts the site to sleep when idle. A sleeping site answers crawlers and callers slowly or not at all.	Approve a paid Render production instance and log retention.	Site remains on the current preview instance.

ID	Decision	What we need from you	Default until answered
A5	Structure conflict. The AI handoff lists pages your July 27 change handoff removed: commercial medical escort, medical equipment, cost and patient-rights content, and separate hospital and case-manager sections.	Confirm the July 27 change handoff remains authoritative. We believe the AI document was written against the old site.	July 27 handoff wins. Removed pages stay removed.
A6	Domestic service page. BLOCKING for that page. The AI handoff proposes a page for domestic United States air ambulance service. The site currently lists the United States as a service area but has no domestic service page.	Confirm AirEvac accepts domestic-only transports, and supply the facts: typical cases, what is coordinated, limitations.	No domestic page is published.
A7	Content management system. The AI handoff recommends a headless CMS (Sanity). The site currently keeps all content in reviewed, version-controlled records with publication gates that block unapproved claims automatically.	Tell us who at AirEvac needs to edit site content without a developer, and how often. That answer decides whether a CMS is worth its cost and the loss of the current approval gates.	No CMS. Content changes go through the build team.

2. Facts only AirEvac can supply

The AI handoff is explicit that coding must not invent or carry over these facts. Until each arrives, the related content stays unpublished or stays limited to what has already been approved.

ID	Fact set	What is needed	Status
F1	Legal and entity facts	Approved legal name, any DBA wording, operator relationships, and which names may appear publicly.	Needed. Site currently publishes only "AirEvac International".
F2	Aviation facts	Certificate-holder wording, whether the certificate number is publishable, operating bases, aircraft range wording, and restrictions.	Needed. Fleet statement ("two Learjet 31A aircraft") is published per the July 27 handoff and awaits final operations approval.
F3	Clinical facts	Medical team roles, equipment, supported and excluded patient categories, and the names and credentials of clinical reviewers willing to be published.	Needed. BLOCKING for reviewer profiles, equipment content, and any medical guide articles.
F4	Accreditations	Current status, scope, expiration, approved logos, exact approved language, and public proof links for every accreditation.	Needed. The site publishes no accreditation until this arrives; the launch gate withholds them automatically.

ID	Fact set	What is needed	Status
F5	Service area	Confirmation of the twelve route pages' operational detail (ground transfer, hospital and discharge, documents), and routine versus case-by-case coverage boundaries.	Drafted by the build team from regional knowledge. Needs an operations read-through; corrections take effect same day.
F6	Photography	Aircraft, crew, and facility images AirEvac has permission to publish, with any people identifiable in them cleared.	Partial. Current images came from the old site; anything better improves every page it touches.
F7	Old-site records	Any Google Search Console history, analytics exports, or paid listing records from the current site, if they exist.	The build team already crawled and mapped all 88 old URLs; account history would confirm nothing was missed.

3. Approvals already pending from the July 27 handoff

These were recorded in the coding completion report and remain open. They are listed here so one document tracks everything owed.

- Operations approval for the conditional 90-minute response copy.
- Pricing and legal approval for the Price Lock Guarantee.
- Privacy approval for the email and fax clinical-document statement.
- Billing and legal decision on required patient and cost notices before launch.
- Operations approval for the two Learjet 31A public fleet statement.
- Operations confirmation of the twelve route pages' detail (item F5 above).

4. Authority only AirEvac can build

The AI handoff is candid that no code can make ChatGPT, Claude, or Google recommend AirEvac. Answer engines weigh what independent sources say. These are business actions, not website actions:

- **Independent listings.** Airport tenant directory at Fort Lauderdale Executive, industry directories, and the EURAMI provider listing once its status is confirmed.
- **References.** Hospitals, case managers, cruise lines, and assistance companies willing to be named as referring partners, in writing.
- **Press.** Local business coverage, aviation and medical transport trade press, and announcements tied to real events.
- **Reviews.** A policy for inviting genuine client reviews on Google. Never gate, filter, or incentivize them; that violates platform rules and FTC guidance.
- **Consistency.** One exact name, address, and phone number everywhere AirEvac appears online. Mismatches read as unreliability to both search engines and AI systems.

5. What the build team will not publish without you

Per the AI handoff's stop rules, coding halts and requests verified input whenever content involves: patient safety, clinical capability, equipment, or staffing; aircraft ownership, operating authority, FAA certification, range, bases,

or availability; superlatives such as best, safest, immediate, guaranteed, worldwide, or insurance-covered; any named accreditor, regulator, hospital, government office, partner, or insurer; or route-page claims about travel time, pricing, direct-flight capability, or customs procedure. This is already enforced by automated tests in the codebase, and it will stay enforced.
